ChatGPT 3.5 ⌄

You
http_req and iterations are same?

ChatGPT
No, `http_req` and `iterations` are not the same in the context of load testing or performance testing.

- `http_req`: This typically refers to the number of HTTP requests made by the virtual users during the execution of a performance test. Each HTTP request corresponds to a specific interaction with the target system or application, such as sending a GET or POST request to retrieve or submit data.

- `iterations`: This refers to the number of iterations or loops executed by each virtual user during the test. Each iteration represents a complete cycle of actions performed by the virtual user, which may include multiple HTTP requests, think time, and other activities.

While `http_req` counts the total number of HTTP requests made by all virtual users combined, `iterations` counts the number of cycles or loops executed by each individual virtual user. Therefore, they are not the same and serve different purposes in performance testing analysis.

(Handwritten annotations:)
- HTTP requests made by VU
- One HTTP Request -> single specific iteration
- iterations or loops executed by each VU
- iteration may include multiple HTTP requests, think time and other activities
